

TESTING BENCH and CHASSIS RECOVERY

model: TRT2.40A

 Stationary test bench and frame recovery with table in treated STEEL

Just only one structure that allows to verify the chassis in each part more the possible corrections, thanks to the possibility to block the chassis in the most interested point, by a quick and efficacious system that uses the 34 calibrated holes of the table, so to operate through the most appropriated tools.

QUICK BLOCKING SYSTEM

For a greater efficacy of the chassis clamping on the table, they are available holders of different measures and drawing. They are easy to apply thanks to the quick blocking system constituted by pins that must be inserted in the proper holes with calibrated diameter.
